Core branch integration

Created: 2026-09-06 03:38 +02:00. ETA: 30–45 minutes.

Explicit user scope: merge nine named Core branches in the existing central Core checkout; Graph is permitted. All other repositories are excluded. No new worktree, force-push or branch deletion.

Affected files and revisions are enumerated in plan.md. Integrate prepared incidence structures/operators and their tests; portable ID serde; Core robot fixtures. Preserve corrected semantic digest algorithm 2 and current parser/admission behavior. Deferred arena work remains a study. Historical Python and registry layouts must not recreate retired owners; connect their history and retain relevant documentation.

Validation: focused regressions followed by complete Core CPU tests, formatting, Clippy, symbols, duplication and Graph consumer checks. Four build jobs, 16 GiB budget; reuse targets, no benchmark campaign. No Simulator actions.

Risk: old implementations can overwrite later fixes; resolve each overlap against its current contract and regression evidence. Preserve current local user changes. Rollback uses original refs and the individual merge commits. All nine heads must be ancestors of final main.
